

4.1 Inner products

Let V be a vector space with field of scalars \mathbb{R} .

An *inner product on V* is a function

$$\langle \cdot, \cdot \rangle: V \times V \rightarrow \mathbb{R}$$

satisfying

1. $\langle \mathbf{u}, \mathbf{v} \rangle = \langle \mathbf{v}, \mathbf{u} \rangle$
2. $\langle \lambda \mathbf{u}, \mathbf{v} \rangle = \lambda \langle \mathbf{u}, \mathbf{v} \rangle$
3. $\langle \mathbf{u} + \mathbf{v}, \mathbf{w} \rangle = \langle \mathbf{u}, \mathbf{w} \rangle + \langle \mathbf{v}, \mathbf{w} \rangle$
4. (a) $\langle \mathbf{u}, \mathbf{u} \rangle \geq 0$
(b) $\langle \mathbf{u}, \mathbf{u} \rangle = 0 \Rightarrow \mathbf{u} = \mathbf{0}$.

247

An *inner product space* is a vector space V together with a choice of inner product.

If W is a subspace of V , then W is itself an inner product space with respect to the inner product of V .

Example 4.1. Consider

$$\langle \mathbf{u}, \mathbf{v} \rangle = u_1 v_1 + 2u_2 v_2$$

on \mathbb{R}^2 .

248

Example 4.2. Consider

$$\langle \mathbf{u}, \mathbf{v} \rangle = u_1v_1 + u_1v_2 + u_2v_2$$

on \mathbb{R}^2 .

Example 4.3. Consider

$$\langle \mathbf{u}, \mathbf{v} \rangle = u_1v_1 - u_2v_2 + u_3v_3$$

on \mathbb{R}^3 .

Example 4.4. Consider

$$\langle f, g \rangle = \int_0^1 f(x)g(x) dx$$

on the vector space of continuous functions $\mathcal{C}([0, 1])$.

$$([0, 1]) = \{f: [0, 1] \rightarrow \mathbb{R} \mid f \text{ continuous}\}$$

$$\textcircled{1} \quad \langle f, g \rangle = \int_0^1 f(x)g(x) dx = \int_0^1 g(x)f(x) dx = \langle g, f \rangle$$

$$\textcircled{2} \quad \langle \lambda f, g \rangle = \int_0^1 \lambda f(x)g(x) dx = \lambda \int_0^1 f(x)g(x) dx = \lambda \langle f, g \rangle$$

$$\begin{aligned} \textcircled{3} \quad \langle f_1 + f_2, g \rangle &= \int_0^1 (f_1(x) + f_2(x))g(x) dx = \int_0^1 f_1(x)g(x) dx + \int_0^1 f_2(x)g(x) dx \\ &= \langle f_1, g \rangle + \langle f_2, g \rangle \end{aligned}$$

$$\textcircled{4} \quad \langle f, f \rangle = \int_0^1 f(x)^2 dx = \int_0^1 (f(x))^2 dx \geq 0$$

since $f(x)^2 \geq 0 \rightarrow$ the integral is greater than 0

$$\textcircled{5} \quad \langle f, f \rangle = \int_0^1 f(x)^2 dx = 0$$

yes ? \mathbb{R} or \mathbb{C} ?

251

4.2 The Cauchy-Schwarz inequality

Let V be an inner product space.

The length of a vector $\mathbf{u} \in V$ is

$$\|\mathbf{u}\| = \sqrt{\langle \mathbf{u}, \mathbf{u} \rangle}.$$

The distance between two vectors $\mathbf{u}, \mathbf{v} \in V$ is

$$d(\mathbf{u}, \mathbf{v}) = \|\mathbf{u} - \mathbf{v}\|.$$

To define the angle between two vectors, we need the Cauchy-Schwarz inequality:

Theorem 4.5. Let \mathbf{u}, \mathbf{v} be vectors in an inner product space V . Then

$$|\langle \mathbf{u}, \mathbf{v} \rangle| \leq \|\mathbf{u}\| \|\mathbf{v}\|$$

Proof.

if $\mathbf{v} = \mathbf{0}$, then both sides are 0

$$\text{let } \alpha = \frac{\langle \mathbf{u}, \mathbf{v} \rangle}{\|\mathbf{v}\|^2} \in \mathbb{R}$$

$$0 \leq \|\mathbf{u} - \alpha \mathbf{v}\|^2 = \langle \mathbf{u} - \alpha \mathbf{v}, \mathbf{u} - \alpha \mathbf{v} \rangle$$

$$= \langle \mathbf{u} - \alpha \mathbf{v}, \mathbf{u} \rangle - \langle \mathbf{u} - \alpha \mathbf{v}, \alpha \mathbf{v} \rangle$$

$$= \langle \mathbf{u}, \mathbf{u} \rangle - \langle \alpha \mathbf{v}, \mathbf{u} \rangle - \langle \mathbf{u}, \alpha \mathbf{v} \rangle$$

$$= \langle \mathbf{u}, \mathbf{u} \rangle - 2\alpha \langle \mathbf{v}, \mathbf{u} \rangle + \alpha^2 \langle \mathbf{v}, \mathbf{v} \rangle$$

253

$$= \|\mathbf{u}\|^2 + \alpha^2 \|\mathbf{v}\|^2 - 2 \cdot \frac{\langle \mathbf{u}, \mathbf{v} \rangle^2}{\|\mathbf{v}\|^2}$$

The angle θ between two vectors $\mathbf{u}, \mathbf{v} \in V$ is defined by the equation

$$\cos(\theta) = \frac{\langle \mathbf{u}, \mathbf{v} \rangle}{\|\mathbf{u}\| \|\mathbf{v}\|} \geq \frac{\langle \mathbf{u}, \mathbf{v} \rangle^2}{\|\mathbf{v}\|^2}$$

Example 4.6. Consider the inner product

$$= \|\mathbf{u}\|^2 + \frac{\langle \mathbf{u}, \mathbf{v} \rangle^2}{\|\mathbf{v}\|^2} - 2 \frac{\langle \mathbf{u}, \mathbf{v} \rangle}{\|\mathbf{v}\|}$$

$$\langle \mathbf{u}, \mathbf{v} \rangle = u_1 v_1 + 2u_2 v_2$$

on \mathbb{R}^2 .

Compute $\|\mathbf{u}\|$, $d(\mathbf{u}, \mathbf{v})$, and the angle between \mathbf{u} and \mathbf{v} for $\mathbf{u} = (2, 5)$ and $\mathbf{v} = (-1, 3)$.

$$\|\mathbf{u}\| = \sqrt{\langle \mathbf{u}, \mathbf{u} \rangle} = \sqrt{4 + 50} = \sqrt{54}$$

$$d(\mathbf{u}, \mathbf{v}) = \|\mathbf{u} - \mathbf{v}\| = \|\langle 3, 2 \rangle\| = \sqrt{9 + 24} = \sqrt{17}$$

$$\cos \theta = \frac{\langle \mathbf{u}, \mathbf{v} \rangle}{\|\mathbf{u}\| \|\mathbf{v}\|} = \frac{28}{\sqrt{54} \cdot \sqrt{1+18}} = \frac{28}{\sqrt{54} \cdot \sqrt{19}}$$

4.3 Orthogonality

Let V be an inner product space.

We say that $\mathbf{u}, \mathbf{v} \in V$ are *orthogonal* if $\langle \mathbf{u}, \mathbf{v} \rangle = 0$.

We say that a subset $S \subset V$ is *orthogonal* if any two distinct vectors in S are orthogonal.

We say that a subset $S \subset V$ is *orthonormal* if it is orthogonal and every vector in S has length 1.

①

②

$\{\hat{\mathbf{i}}, \hat{\mathbf{j}}, \hat{\mathbf{k}}\}$ is an orthonormal subset of \mathbb{R}^3

255

Example 4.7. In \mathbb{R}^2 with the dot product,

the vectors $(1, 1)$ and $(1, -1)$ are *orthogonal*

$$\langle \mathbf{u}, \mathbf{v} \rangle = 0$$

not orthonormal since $\|\langle \mathbf{u}, \mathbf{u} \rangle\| = \sqrt{2} \neq 1$

the vectors $(1/\sqrt{2}, 1/\sqrt{2})$ and $(1/\sqrt{2}, -1/\sqrt{2})$ are

orthonormal

256

Example 4.8. In $\mathcal{C}([-1, 1])$ with inner product

$$\langle f, g \rangle = \int_{-1}^1 f(x)g(x) dx,$$

the functions x^2 and x^3 are

$$\begin{aligned} \langle x^2, x^3 \rangle &= \int_{-1}^1 x^5 dx = \left. \frac{1}{6} x^6 \right|_{-1}^1 \\ &= \frac{1}{6} (1 - 1) = 0 \end{aligned}$$

since x^5 odd function \rightarrow symmetric

$$\langle x^2, x^2 \rangle = \int_{-1}^1 x^4 dx = \left. \left(\frac{1}{5} x^5 \right) \right|_{-1}^1 = \frac{2}{5} \neq 1$$

$$\left\| \frac{1}{\sqrt{\frac{2}{5}}} x^2 \right\| = 1$$

257

Theorem 4.9. Let $S = \{\mathbf{v}_1, \dots, \mathbf{v}_n\}$ be an orthogonal set of nonzero vectors in an inner product space. Then S is linearly independent.

(We call S an *orthogonal basis* for $\text{Span}(S)$. Moreover, if S is an orthonormal set, we call it an *orthonormal basis* for $\text{Span}(S)$.)

Suppose linearly relation

$$a_1 \mathbf{v}_1 + \dots + a_n \mathbf{v}_n = \mathbf{0} \quad (1)$$

fix \mathbf{v}_i $1 \leq i \leq n$, Take inner product of (1) write as

$$\langle \mathbf{v}_i, a_1 \mathbf{v}_1 + \dots + a_n \mathbf{v}_n \rangle = \langle \mathbf{v}_i, \mathbf{0} \rangle = 0$$

$$\langle a_1 \mathbf{v}_1 + \dots + a_n \mathbf{v}_n, \mathbf{v}_i \rangle$$

$$\langle a_1 \mathbf{v}_1, \mathbf{v}_i \rangle + \langle a_2 \mathbf{v}_2, \mathbf{v}_i \rangle + \dots + \langle a_n \mathbf{v}_n, \mathbf{v}_i \rangle$$

$$= a_1 \langle \mathbf{v}_1, \mathbf{v}_i \rangle + a_2 \langle \mathbf{v}_2, \mathbf{v}_i \rangle + \dots + a_n \langle \mathbf{v}_n, \mathbf{v}_i \rangle$$

$$0 + \dots + a_i \langle \mathbf{v}_i, \mathbf{v}_i \rangle + \dots + 0 = 0$$

$$\text{so } a_i \langle \mathbf{v}_i, \mathbf{v}_i \rangle = 0$$

$$\Rightarrow a_i = 0 \text{ or } \langle \mathbf{v}_i, \mathbf{v}_i \rangle = 0$$

so $a_i = 0$

non zero vector

If $\{\mathbf{u}_1, \dots, \mathbf{u}_n\}$ is an orthonormal basis for V , then every $\mathbf{v} \in V$ can be written

$$\mathbf{v} = a_1 \mathbf{u}_1 + \dots + a_i \mathbf{u}_i + \dots + a_n \mathbf{u}_n \quad \text{for } a_1, \dots, a_n \in \mathbb{R}$$

$$\begin{aligned} \langle \mathbf{u}_i, \mathbf{v} \rangle &= \langle \mathbf{u}_i, a_1 \mathbf{u}_1 + \dots + a_n \mathbf{u}_n \rangle \\ &= a_i \langle \mathbf{u}_i, \mathbf{u}_i \rangle = a_i \end{aligned}$$

We will soon see that every inner product space has orthonormal bases.

Therefore,

$$\mathbf{v} = \langle \mathbf{u}_1, \mathbf{v} \rangle \mathbf{u}_1 + \langle \mathbf{u}_2, \mathbf{v} \rangle \mathbf{u}_2 + \dots + \langle \mathbf{u}_n, \mathbf{v} \rangle \mathbf{u}_n$$

259

Proposition 4.10. Let \mathbf{u}, \mathbf{v} be vectors in an inner product space V , with $\mathbf{u} \neq \mathbf{0}$. Then the vector

$$\mathbf{v} - \frac{\langle \mathbf{v}, \mathbf{u} \rangle}{\langle \mathbf{u}, \mathbf{u} \rangle} \mathbf{u}$$

is orthogonal to \mathbf{u} .

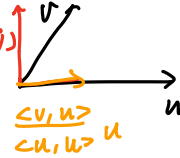

$$\begin{aligned} &\langle \mathbf{u}, \mathbf{v} - \frac{\langle \mathbf{v}, \mathbf{u} \rangle}{\langle \mathbf{u}, \mathbf{u} \rangle} \mathbf{u} \rangle \\ &= \langle \mathbf{u}, \mathbf{v} \rangle - \langle \mathbf{u}, \underbrace{\frac{\langle \mathbf{v}, \mathbf{u} \rangle}{\langle \mathbf{u}, \mathbf{u} \rangle}}_{\text{scalar}} \mathbf{u} \rangle \\ &= \langle \mathbf{u}, \mathbf{v} \rangle - \frac{\langle \mathbf{v}, \mathbf{u} \rangle}{\cancel{\langle \mathbf{u}, \mathbf{u} \rangle}} \langle \mathbf{u}, \mathbf{u} \rangle \\ &= 0 \end{aligned}$$

260

This motivates the definition: the *orthogonal projection of \mathbf{v} onto \mathbf{u}* is

$$\text{proj}_{\mathbf{u}}(\mathbf{v}) = \frac{\langle \mathbf{v}, \mathbf{u} \rangle}{\langle \mathbf{u}, \mathbf{u} \rangle} \mathbf{u}.$$

$\mathbf{v} - \text{proj}_{\mathbf{u}}(\mathbf{v})$

If \mathbf{u} happens to be a unit vector, then the formula simplifies to

$$\text{proj}_{\mathbf{u}}(\mathbf{v}) = \langle \mathbf{v}, \mathbf{u} \rangle \mathbf{u}.$$

Moreover, we can project onto a subspace W of V as follows: let $\{\mathbf{u}_1, \dots, \mathbf{u}_m\}$ be an orthonormal basis for W . The *orthogonal projection of \mathbf{v} onto W* is

$$\begin{aligned} \text{proj}_W(\mathbf{v}) &= \text{proj}_{\mathbf{u}_1}(\mathbf{v}) + \dots + \text{proj}_{\mathbf{u}_m}(\mathbf{v}) \\ &= \langle \mathbf{v}, \mathbf{u}_1 \rangle \mathbf{u}_1 + \dots + \langle \mathbf{v}, \mathbf{u}_m \rangle \mathbf{u}_m. \end{aligned}$$

Note that this defines a linear transformation $\text{proj}_W: V \rightarrow V$ with image W .

261

4.4 The Gram-Schmidt orthonormalisation process

Let V be an inner product space.

There is a procedure that starts with an arbitrary basis $\mathcal{B} = \{\mathbf{v}_1, \dots, \mathbf{v}_n\}$ of V and returns an orthonormal basis $\mathcal{C} = \{\mathbf{u}_1, \dots, \mathbf{u}_n\}$.

let \mathbf{u}_1 be $\frac{1}{\|\mathbf{v}_1\|} \mathbf{v}_1$, then $\{\mathbf{u}_1\}$ is an orthonormal set

let \mathbf{w}_2 be $\mathbf{v}_2 - \text{proj}_{\text{span}\{\mathbf{u}_1\}}(\mathbf{v}_2) = \mathbf{v}_2 - \langle \mathbf{v}_2, \mathbf{u}_1 \rangle \mathbf{u}_1$

$$\mathbf{u}_2 = \frac{\mathbf{w}_2}{\|\mathbf{w}_2\|}$$

let $\mathbf{w}_3 = \mathbf{v}_3 - \text{proj}_{\text{span}\{\mathbf{u}_1, \mathbf{u}_2\}}(\mathbf{v}_3)$

$$= \mathbf{v}_3 - (\langle \mathbf{v}_3, \mathbf{u}_1 \rangle \mathbf{u}_1 + \langle \mathbf{v}_3, \mathbf{u}_2 \rangle \mathbf{u}_2)$$

$$\mathbf{u}_3 = \frac{1}{\|\mathbf{w}_3\|} \mathbf{w}_3$$

Example 4.11. Let $W = \text{Span}\{v_1, v_2, v_3\} \subset \mathbb{R}^4$ with the dot product, where

$$v_1 = (1, 1, 1, 1) \quad v_2 = (2, 4, 2, 4) \quad v_3 = (1, 5, -1, 3).$$

(a) Find an orthonormal basis for W .

(b) Find the point of W closest to the point $v = (1, 2, 3, 0)$.

$$(a) \quad u_1 = \frac{v_1}{\|v_1\|} = \frac{(1, 1, 1, 1)}{2} = \frac{1}{2}(1, 1, 1, 1)$$

$$v_2 = v_2 - \text{proj}_{\langle u_1 \rangle}(v_2) \rightarrow \langle \overline{u_1}, \overline{v_2} \rangle \cdot \overline{u_1}$$

$$= (2, 4, 2, 4) - \frac{1}{2} \cdot 12(1, 1, 1, 1) = (2, 4, 2, 4) - (3, 3, 3, 3) \\ = (-1, 1, -1, 1)$$

$$u_2 = \frac{1}{2}(-1, 1, -1, 1)$$

$$w_3 = v_3 - \langle u_1, v_3 \rangle u_1 - \langle u_2, v_3 \rangle u_2 \\ = (1, 5, -1, 3) - \frac{1}{2} \cdot 8(1, 1, 1, 1) - \frac{2}{2} \cdot \frac{1}{2}(-1, 1, -1, 1)$$

$$= (1, 1, -1, -1)$$
